

JOINTBOX

ISP Management Platform
Complete User Guide

How to use every feature through the web interface
Admin panel • Subscriber portal • Billing • Network • Reports

1. Getting Started

Jointbox has two separate web interfaces:

- **Admin panel** — for you and your staff. Open **http://localhost:3000** and sign in with your staff email and password. This is where you manage everything.
- **Subscriber portal** — for your customers. They open **http://localhost:3000/portal** and sign in with their internet connection username and password.

The admin panel has a sidebar on the left with every section. The top bar shows the current page, a live clock, and an online indicator. This guide follows the sidebar top to bottom.

First time? Do things in this order: create your ISP & branch (Organization) → an IP pool → a package → an area → then add subscribers. Everything else builds on those.

Signing in

- 1 Go to <http://localhost:3000> — you land on the login page.
- 2 Enter your staff email and password, click Sign in.
- 3 If your account has two-factor authentication on, you'll be asked for a 6-digit code from your authenticator app.
- 4 You arrive at the Dashboard with the full sidebar.

2. Organization (ISPs, Branches, Resellers)

Sidebar → Organization. This is your company structure and reseller network. Three tabs across the top.

ISPs tab

An ISP is a company you operate. Most people have one.

- 1 Click the Organization menu, then the ISPs tab.
- 2 Type a name in the box and click Add ISP.
- 3 It appears in the list with a branch count.

Branches tab

Branches are locations or offices under an ISP. Each subscriber and staff member can belong to a branch.

- 1 Open the Branches tab.
- 2 Type a branch name, choose the ISP from the dropdown, optionally add an address.
- 3 Click Add branch. Live counts of subscribers and staff show per branch.

Resellers tab

Shows your reseller hierarchy as a tree: reseller → sub-reseller → retailer. For each you can set a commission percentage and manage their wallet.

- **Commission %** — type a number and click Save. On every payment a subscriber makes, their salesperson and everyone above them in the tree earns that percentage automatically into their wallet.
- **Wallet** — click Wallet to top up (add funds) or withdraw (pay out), and see the full history of every commission and adjustment.

To build a chain, create users with roles RESELLER / SUB_RESELLER / RETAILER in the Users section and set each one's parent. Then set commission % here.

3. Packages, IP Pools & Areas

IP Pools

Sidebar → IP Pools. Define the ranges of IP addresses your routers hand out. Create a pool with a name, network, and subnet. A package can be linked to one pool.

Packages

Sidebar → Packages. Your internet plans.

- 1 Click New/Add package.
- 2 Set name, price, duration in days, download and upload speed (Mbps), and optionally a burst speed.
- 3 Assign an IP pool if you use one.
- 4 Save. The package is now selectable when adding subscribers. Sub-tabs let you manage taxes, policies and allocations.

Areas

Sidebar → **Areas**. Geographic zones for organising and filtering subscribers. Add an area with a name and city.

4. Subscribers (your customers)

Sidebar → Subscribers. The heart of daily work. Create, search, import/export, and manage every customer.

Add a subscriber

- 1 Click New / Add subscriber.
- 2 Fill full name, phone, a login username and password (these are what the customer uses to connect to the internet and to log into the portal).
- 3 Pick a package, area, and the salesperson/reseller responsible.
- 4 Save. Jointbox automatically pushes the login to RADIUS so the customer can dial in immediately.

When you save a subscriber, they are synced to FreeRADIUS with their password, speed limit and IP pool. If a WELCOME message template is active, a welcome SMS is queued automatically.

Everyday actions

- **Search** — type a name, phone, or username to filter instantly.
- **Open a subscriber** — see their profile, package, status and RADIUS state.
- **Activate / Renew** — extend service and generate the invoice + payment in one step.
- **Import / Export** — bulk-load customers from a file, or export the list.
- **Bulk actions** — select many and change service settings or delete together.

Subscriber status meanings

Status	Meaning
ACTIVE	Service is on; can connect to the internet.
EXPIRED	Past the expiry date; blocked until renewed.
SUSPENDED	Manually or automatically blocked.
INACTIVE	Not currently in service.

5. Invoices & Payments

Invoices

Sidebar → **Invoices**. Bills raised against subscribers.

- 1 Click New invoice, pick the subscriber, enter amount, tax/discount if any, and a due date.
- 2 Save. The invoice is UNPAID and the accounting ledger is updated automatically.

Payments

Sidebar → **Payments**. Record money received.

- 1 Click New payment, choose the invoice and subscriber, enter the amount and method (cash, bank, card, online).
- 2 Save. The invoice is marked PAID (or PARTIAL), the ledger records the cash, and any reseller commission is paid out automatically.

Every payment does four things at once: marks the invoice paid, posts to the double-entry ledger, credits reseller commissions, and sends a payment-received message if that template is active.

6. Accounting

Sidebar → **Accounting**. Full double-entry books. Five tabs.

Tab	What it shows / does
Ledger	Every debit and credit posted automatically by invoices, payments, expenses, refunds. Filter by account.
Cashflow	Money in vs money out per day, over 30/60/90 days, with totals.
Expenses	Record business costs (bandwidth, salaries...). Each posts to the ledger. Delete posts a reversal.
Balances	Every subscriber's prepaid wallet. Top up an account and view its history.
Automation	Run or preview the billing robots (see next section).

Reversing an invoice / refunding a payment

From the Accounting APIs (and invoice/payment screens) you can reverse an invoice or refund a payment. Both require a written reason, which is saved to the audit log. Refunds can be returned as cash or credited to the customer's wallet.

7. Billing Automation

Accounting → **Automation tab**. Jointbox can run your billing every night by itself. Three jobs:

Job	Runs at	What it does
Auto-invoice	00:30	Creates invoices for subscribers whose plan is about to expire.
Auto-renewal	01:00	For customers with wallet balance: charges them, renews, and re-enables their connection.
Suspension	02:00	Blocks and disconnects customers who expired and didn't pay.

Testing safely

- 1 Open Accounting → Automation.
- 2 Leave the 'Dry run' box ticked — this previews without changing anything.
- 3 Click a job button. A run report appears showing exactly who would be affected.
- 4 Only when the preview looks right, untick Dry run and run it for real.

You can turn all automation off by setting `BILLING_AUTOMATION=off` in the backend `.env` file.

8. Communication (SMS & Email)

Sidebar → **Communication**. Reach customers automatically or in bulk. Three tabs.

Templates

Write a message once with variables and bind it to an event so it fires automatically.

- Variables like {name}, {amount}, {expiry}, {invoiceNo}, {package} are filled in per customer, with a live preview as you type.
- Bind to an event: WELCOME, INVOICE_CREATED, PAYMENT_RECEIVED, EXPIRY_REMINDER, RENEWAL, SUSPENSION. Toggle ON to activate.
- Expiry reminders go out daily at 9am to anyone expiring in 3, 1, and 0 days.

Send

Broadcast to everyone or filter by status, area, or package. Also a Send-test box for a single message.

Log

Every message ever sent, per customer, with status: SENT, FAILED (with retry), or SIMULATED.

Until you add a real SMS/email provider in the backend `.env`, everything runs in SIMULATED mode — messages are logged but not actually delivered, so you can test freely. The page header shows whether each channel is live or simulated.

9. Subscriber Portal & Online Payments

Your customers get their own self-service site at <http://localhost:3000/portal>. They log in with their connection username and password.

What customers can do

- **Overview** — see status, package, expiry date, and wallet balance.
- **Usage** — whether they're online now, plus recent sessions with data used and time.
- **Invoices** — view bills and click Pay now to pay online.
- **Support** — open a ticket (it appears in your Complaints section) and read staff replies.

Online payment gateways

Add gateway credentials in the backend .env to accept real money: Stripe, bKash, or SSLCommerz. In development a built-in SANDBOX gateway lets you test the whole flow with fake payments. When a customer pays, Jointbox automatically marks the invoice paid, extends their expiry, and re-enables their connection.

Give customers the portal link to cut down on 'when do I expire / did you get my payment' phone calls — they self-serve and pay themselves.

10. Live Network

Sidebar → Live Network. See and control who is online in real time (auto-refreshes every 5 seconds).

- Live list of connected customers with IP, MAC, uptime, data used and current speed. Top talkers highlighted.
- **Disconnect** — drop a session immediately (real router disconnect where supported).
- **MAC binding** — lock a customer to specific device(s). Type a MAC or use Auto-learn to grab the one they're using now, so nobody else can use their login.

11. NAS / Routers, Vouchers, Complaints

- **NAS / Routers** — register your routers so RADIUS accepts them and you can check reachability.
- **Vouchers** — generate prepaid codes for customers.
- **Complaints** — the support ticket queue; tickets opened from the portal land here.

12. Security

Sidebar → **Security**. Three tabs to control staff access.

Permissions

A grid of roles (SALES, RESELLER, etc.) against every module, with Read and Write checkboxes.

- A role with nothing ticked is unrestricted — nothing changes until you deliberately configure it.
- Tick what a role may see (Read) or change (Write). Write includes Read. Save per role.
- SUPER_ADMIN always has full access and can never be locked out.

Two-Factor Auth

- 1 Click Set up 2FA. A secret key appears.
- 2 Add it to Google Authenticator (or any TOTP app) using 'Enter a setup key'.
- 3 Type the 6-digit code it shows and click Activate. Future logins now require the code.

Active Sessions

See everyone currently logged in with their IP and last activity. Force logout ends any session remotely.

13. Trace Search (find anything instantly)

Sidebar → **Trace Search**. The fastest way to help a customer.

- 1 Type anything — phone number, username, name, invoice number, or payment number.
- 2 Results appear live across subscribers, invoices, payments, tickets and staff.
- 3 Click a result to open the customer's Timeline — their entire history in one scroll: account created, every invoice, payment, ticket, message sent, wallet change, and network session, in order.

Support scenario: a customer calls with only a phone number. Paste it, click their name, and you instantly see they're online, their last payment failed, and the reminder SMS was sent — in about three seconds.

14. Logs, Reports & Settings

- **Logs** — login history, staff activity, system and network/RADIUS logs.
- **Reports** — business summaries and exports.
- **Settings** — general configuration; SMS/email and payment gateway credentials live in the backend .env file.

Jointbox ISP Management Platform — User Guide. Screens follow the left sidebar top to bottom. For the technical setup checklist and end-to-end test script, see CHECKLIST.md and TESTING.md in the project folder.
