ISP CRM User Guide

Oct 28, 2026 · @Kamran Sajjad

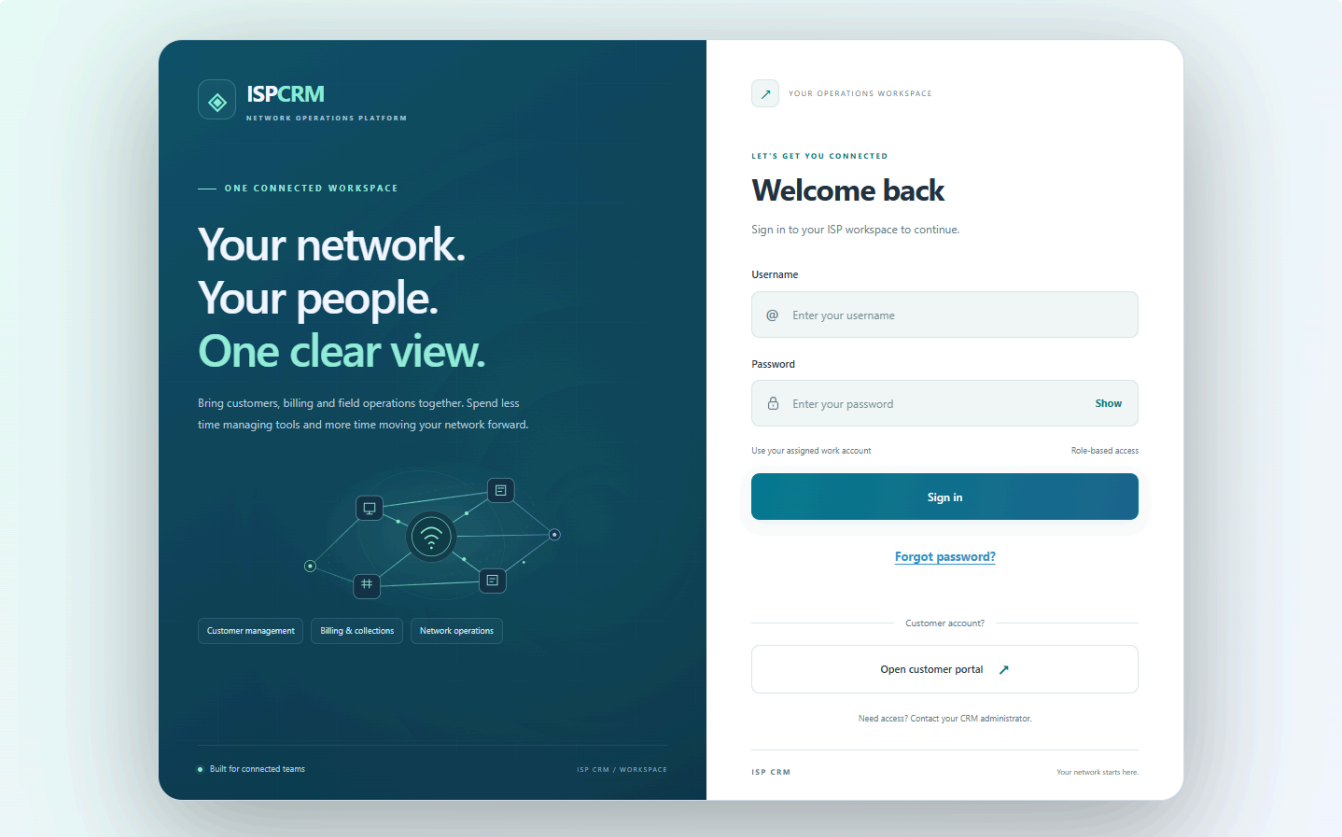

This guide explains every part of the ISP CRM in plain words: what each page is for and how to do the common jobs. Each section matches a menu item in the CRM.

Getting started

Sign in with the username and password your administrator gave you. Each person has their own account, and the CRM only shows the pages your role allows.

Signing in

1. Open the CRM link in your browser (for example http://localhost:3000 on the office computer).
2. Type your username and password. Press **Show** to check the password; a warning appears if Caps Lock is on.
3. Press **Sign in**. The button shows a loading spinner until your workspace opens.

Customers do not sign in here. They use the **customer portal** link on the sign-in page (see Customer portal and other tools).

The top bar

Control	What it does
☰ menu	Opens or closes the left menu. When it opens, the page moves right so nothing is hidden.
City	Shows the whole CRM for one city only, or All cities. Your choice is remembered on that browser.
Theme	Light, Dark or Glossy look. Only changes colours, never data.
PKT	All times are Pakistan time.
Your name and role	Shows who is signed in.
Password	Change your own password.
Sign out	Ends your session. Always sign out on shared computers.

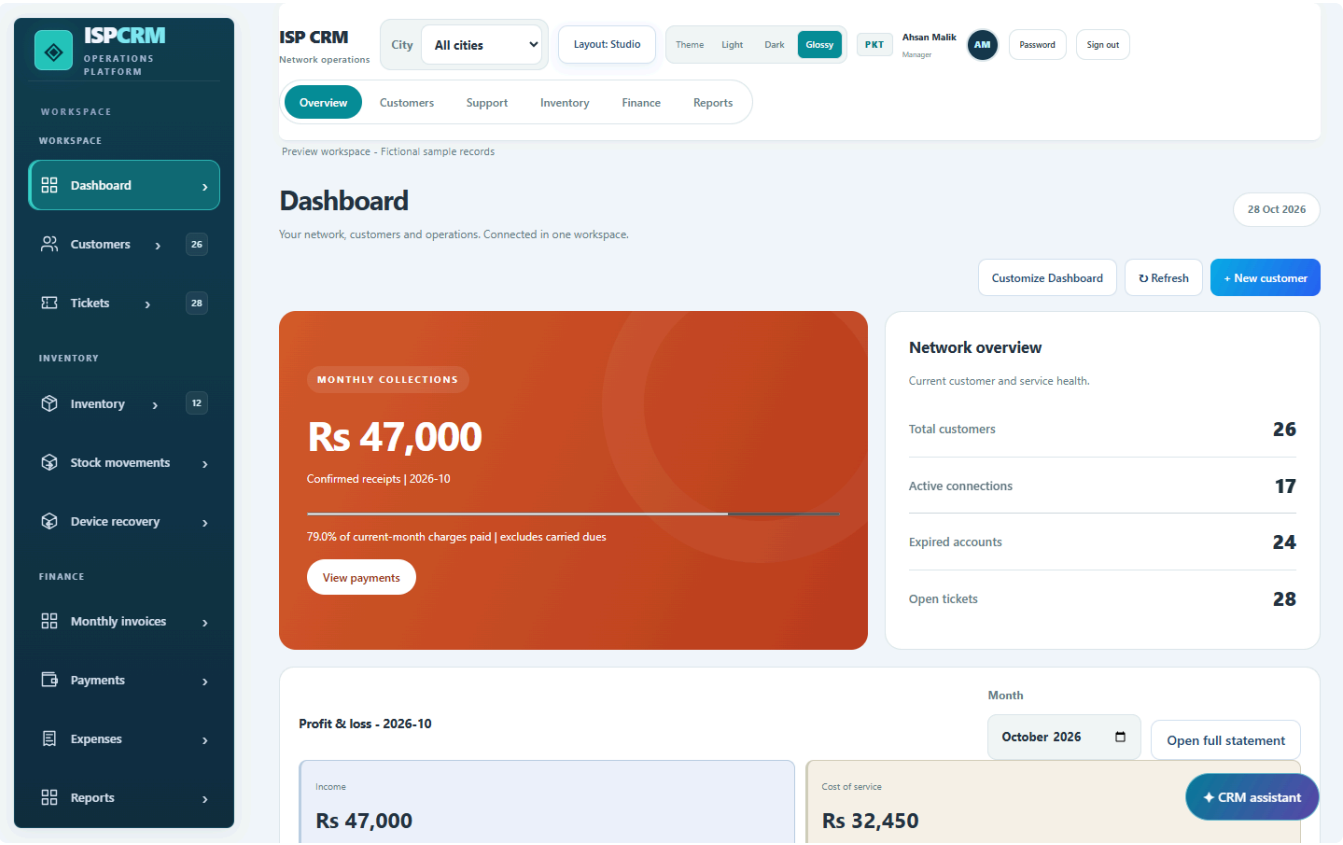

The left menu lists the main pages in groups: Workspace (Dashboard, Customers, Tickets), Inventory (Inventory, Stock movements, Device recovery), Finance (Monthly invoices, Payments, Expenses, Reports), Team & settings (Staff, Settings) and Operations. The small number beside a page is how many records it holds. Under the top bar, the tabs Overview, Customers, Support, Inventory, Finance and Reports are shortcuts to the same pages. You only see the ones your role can use.

Pages and lists. Most pages show a table with a search box, filters, **+ Add**, **Export CSV** and **Print**. Click a row's buttons to view, edit or act on it. Numbers count up when a page opens; that is only an animation.

Tip: if a page looks out of date after an update, press **Ctrl+F5** once to reload it fully.

Dashboards

The Dashboard is the first page after sign-in and answers "how is the business doing today?" Every number updates from live records; nothing is typed in by hand.

Panel	What it tells you
Monthly collections	Money received this month and the share of this month's bills already paid.
Network overview	Total customers, active connections, expired accounts and open tickets.
Profit & loss	This month's income, cost of service (package/bandwidth cost), business expenses and net profit. Pick a month or press **Open full statement**.
Business at a glance	Active customers, MRC expected, MRC and OTC collected this month, open tickets, available staff, low-stock items.
Collections over time	A chart of daily or monthly receipts, with the best day and month.
Ticket work queue	Unassigned, overdue and urgent tickets.
Stock watch	Items at or below their minimum quantity.

Panel	What it tells you
Recent receipts	The latest payments recorded.
Expenses & cash flow	Expenses paid this month and net cash.

The **Management dashboard** (sales, billing and collections) adds daily and monthly performance: total sales, MRC bills raised, collections by payment method, terminations and the monthly fee lost to them, equipment recoveries pending, largest outstanding balances and day-wise graphs.

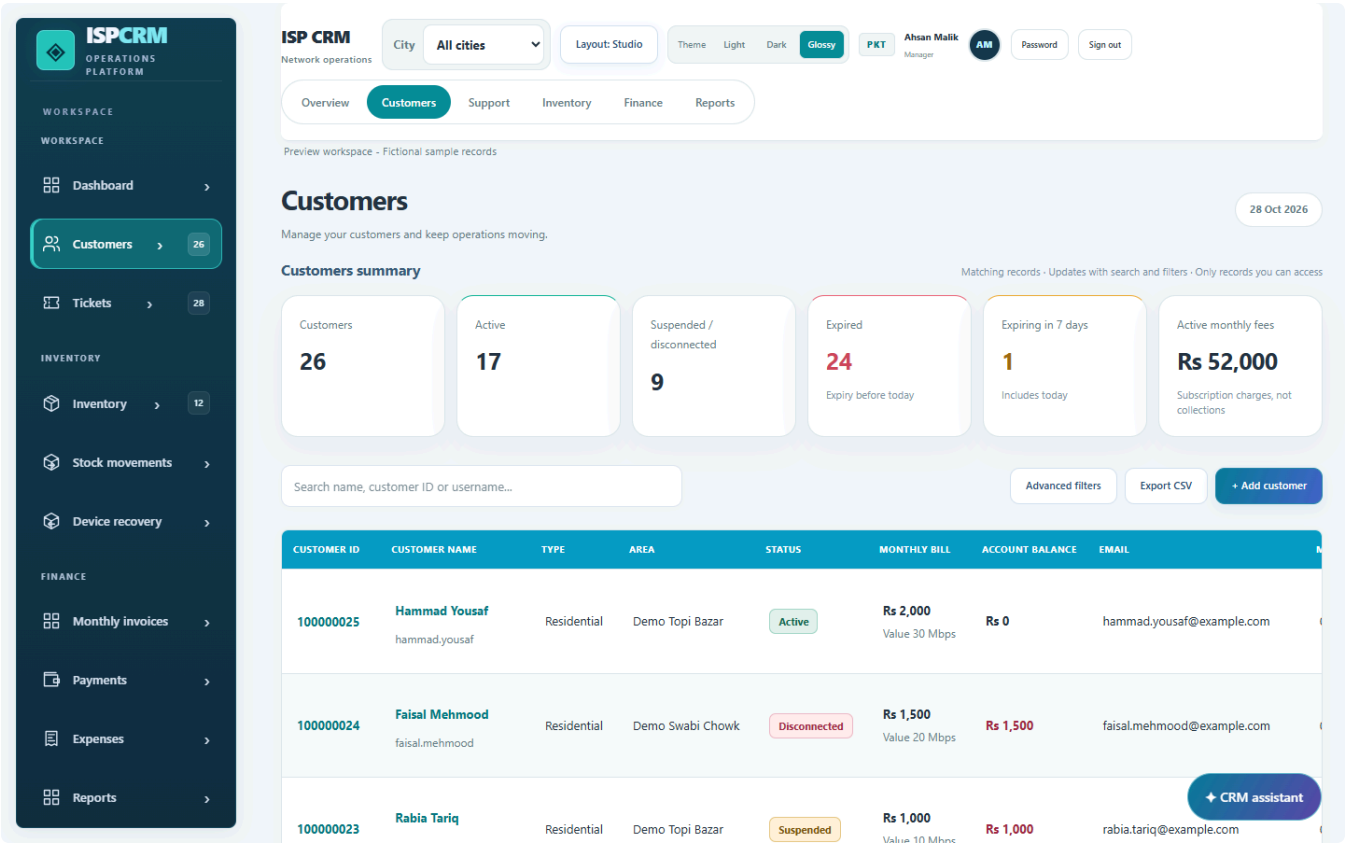

Customize Dashboard lets you hide or show panels and **Save layout**. **Refresh** reloads the numbers; **+ New customer** is a shortcut.

Words used on the dashboards

- **MRC**: monthly recurring charge, the customer's monthly bill.
- **OTC**: one-time charge, such as installation, router or a service visit.
- **Expired**: the account's expiry date has passed and it has not been recharged.
- **Stock issued** is shown separately and is not taken out of profit.

Customers

The Customers page holds every subscriber account: who they are, where they are, which package they use and what they owe. The cards at the top count customers, active, suspended/disconnected, expired, expiring in 7 days and total active monthly fees.

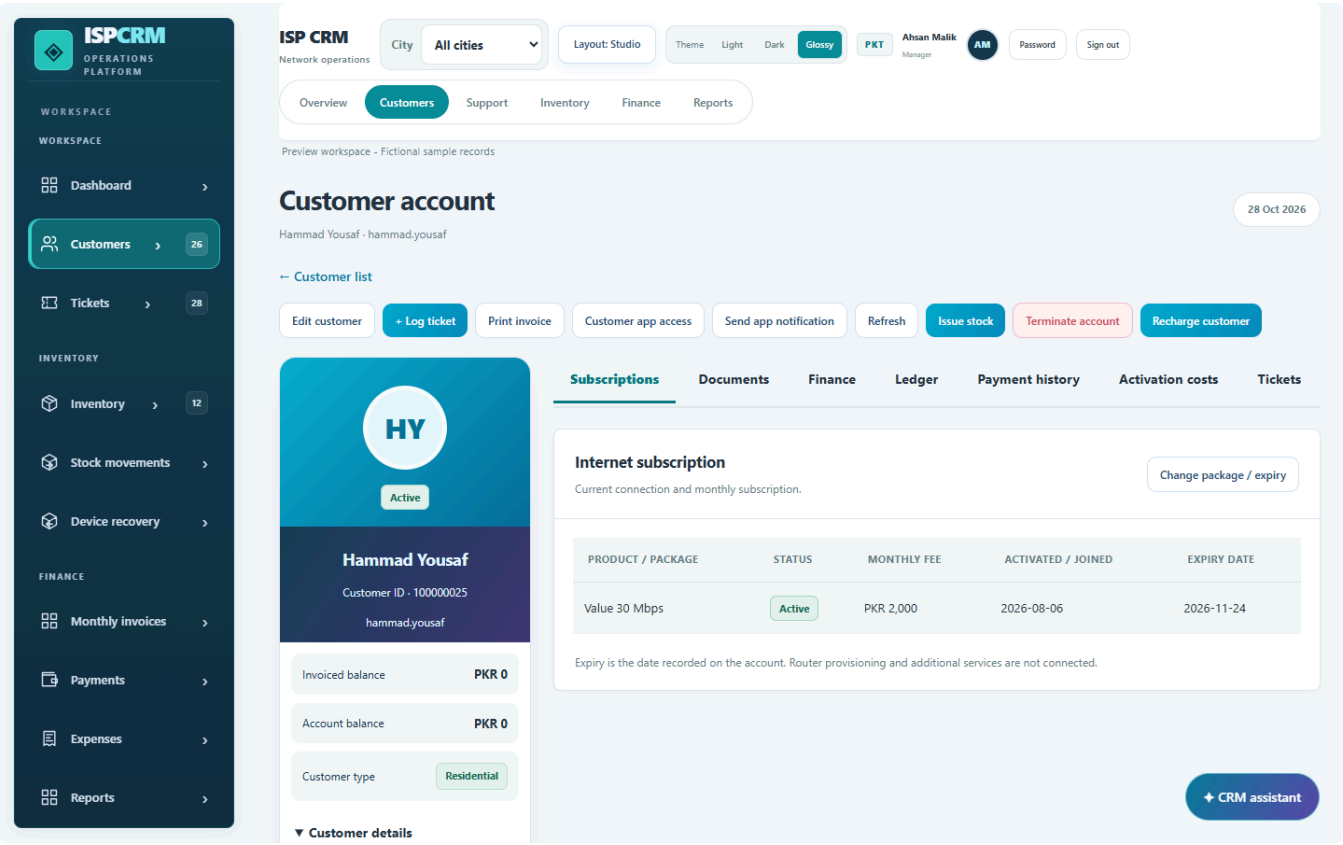

The list shows customer ID, name, type, area, status, **monthly bill** (with the package name), account balance and contact details. Use the search box (name, customer ID or username), **Advanced filters**, or **Export CSV** to download the list.

Add a customer

1. Press **+ Add customer**.
2. Fill in name, phone, username, package and joining date. Email, CNIC, passport and NTN are optional.
3. Choose the **Area**. Only active areas from Operations → Areas appear, and each area belongs to a city.
4. Optionally set the map location (latitude and longitude) so the customer shows on the network map.
5. Save. The expiry date is set 30 days after joining unless you enter one yourself.

Customer statuses: Active, Suspended, Disconnected, Terminated. Customer types: Residential, Business, Corporate.

The customer account page. Click a customer's name to open their account.

Tab	What it shows
Subscriptions	Package, status, monthly fee, joining and expiry dates. **Change package / expiry** is here.
Documents	CNIC copies, agreements and other files uploaded for this customer.
Finance	Bills and balances for this customer.
Ledger	Every charge and payment in date order, with the running balance.
Payment history	All payments received from this customer.
Activation costs	Installation and equipment charges.
Tickets	Support tickets logged for this customer.

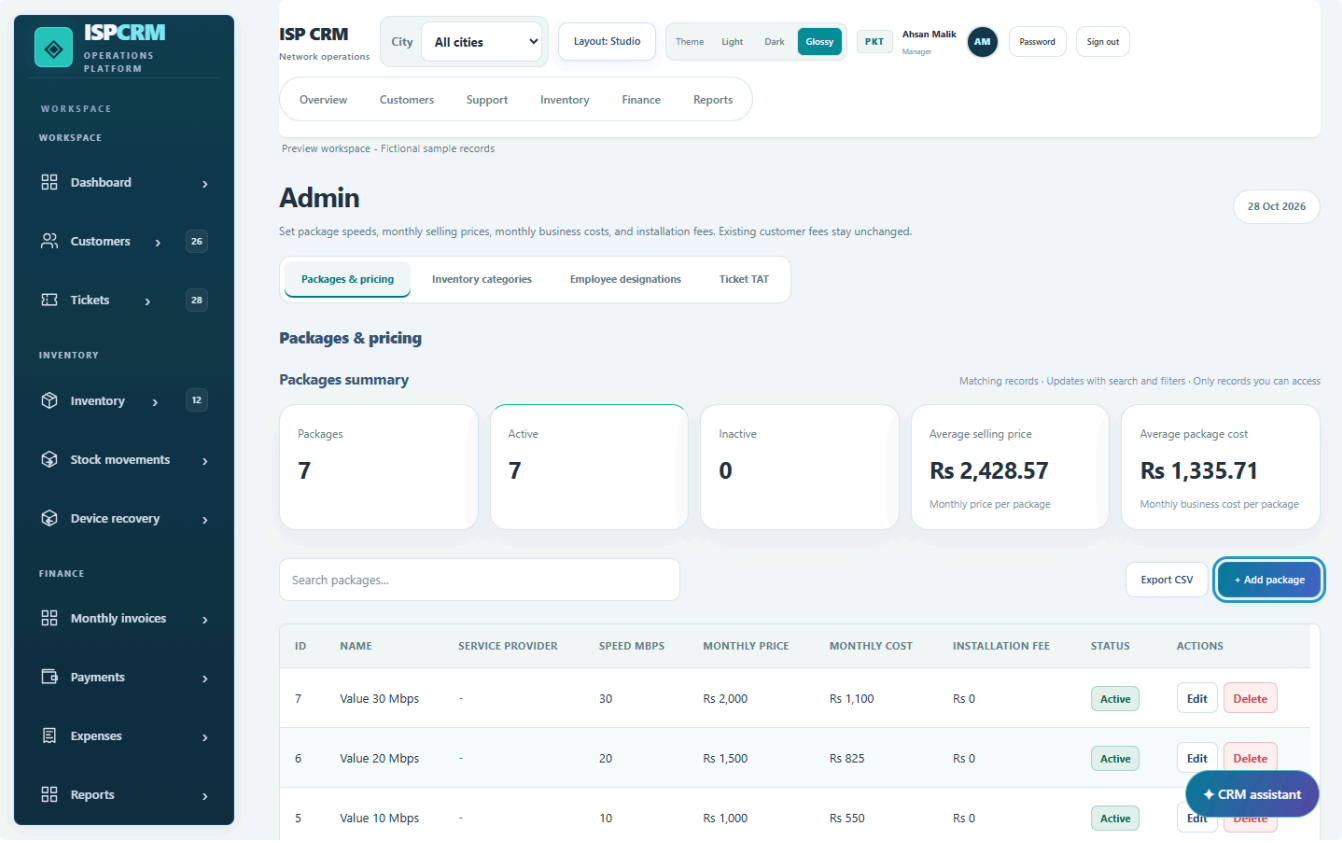

The buttons above the tabs do the common jobs: **Edit customer**, **+ Log ticket**, **Print invoice**, **Customer app access** (portal login), **Send app notification**, **Issue stock** (router, ONT, cable), **Terminate account** and **Recharge customer**.

Terminating a customer. Press **Terminate account**, choose the **reason** from the list (shifted to another ISP, relocated, non-payment, slow speed, frequent disconnections, price too high, no longer needs internet, complaint not resolved, duplicate/test account, other) and add details if needed. If the customer still has CRM equipment, a recovery task appears under **Device recovery** so a technician collects it.

Billing and payments

The CRM raises each customer's monthly bill automatically, and a full payment for the current month recharges the account for 30 days. You only record the money received; the bill, receipt, status and expiry follow on their own.

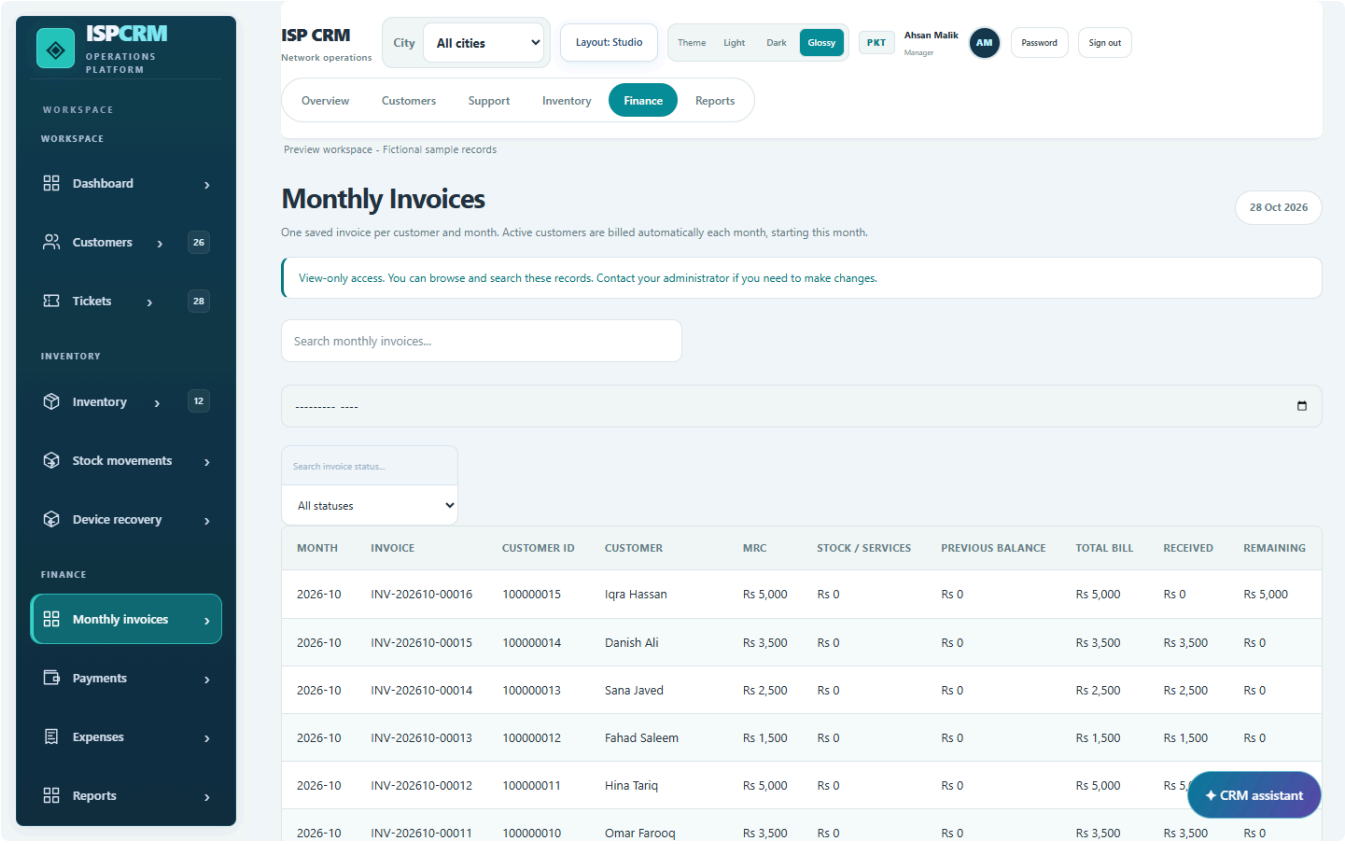

Packages (Settings → Packages) set what each plan costs.

Field	Meaning
Name, Speed Mbps	How the plan appears on bills and forms.
Service provider	Transworld Panel, Nayatel bandwidth or Transworld Bandwidth.

Field	Meaning
Monthly price	What the customer pays each month (MRC).
Monthly cost	What the plan costs you upstream. Used for profit & loss.
Installation fee	Default one-time installation charge.
Status	Only Active packages can be chosen for customers.

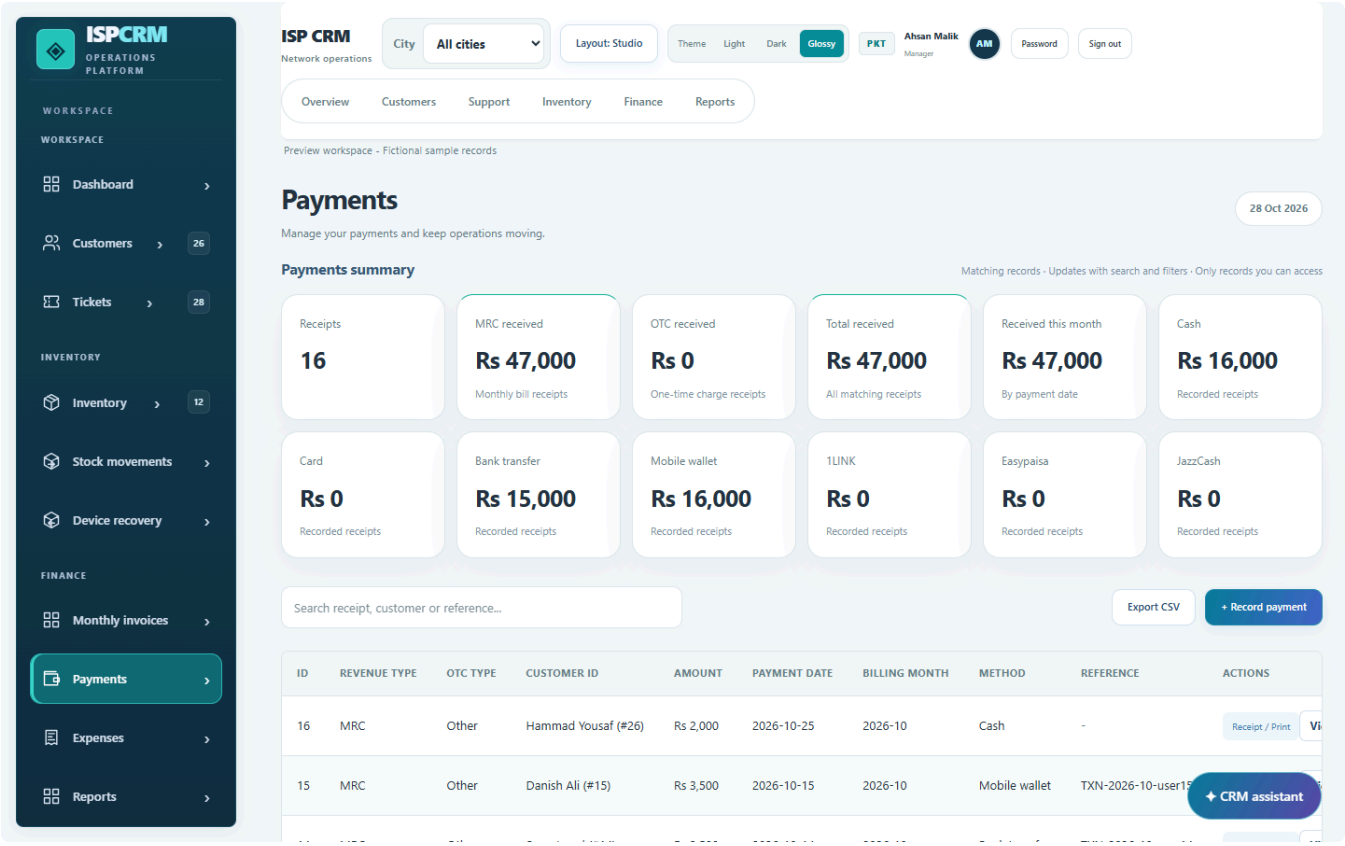

Monthly invoices. At the start of each month the CRM creates a bill for every active customer. A bill shows this month's charge, any previous unpaid balance and the total. Print it from the customer's page (**Print invoice**) or from the Monthly invoices page.

Record a payment (recharge)

1. Open the customer and press **Recharge customer**, or go to Payments → **+ Add**.
2. Pick the customer (you can search by the 9-digit customer ID).
3. The amount due fills in automatically. Change it for a partial payment.

4. Choose the payment date, billing month and method: Cash, Card, Bank transfer or Mobile wallet.
5. Save. A permanent receipt is created that you can print or save as PDF.

What happens after saving:

- **Full payment for the current month:** the customer becomes Active and the expiry moves 30 days forward. This happens once per month.
- **Partial payment:** it is saved, but the account is not activated unless a manager ticks **Activate now and carry unpaid amount to next bill**. The unpaid part is added to next month's bill.
- **Past or future month:** saved, without automatic activation.

Example: bill Rs 2,000, customer pays Rs 800 and partial activation is approved. Rs 1,200 carries over, so next month's bill shows Rs 3,200.

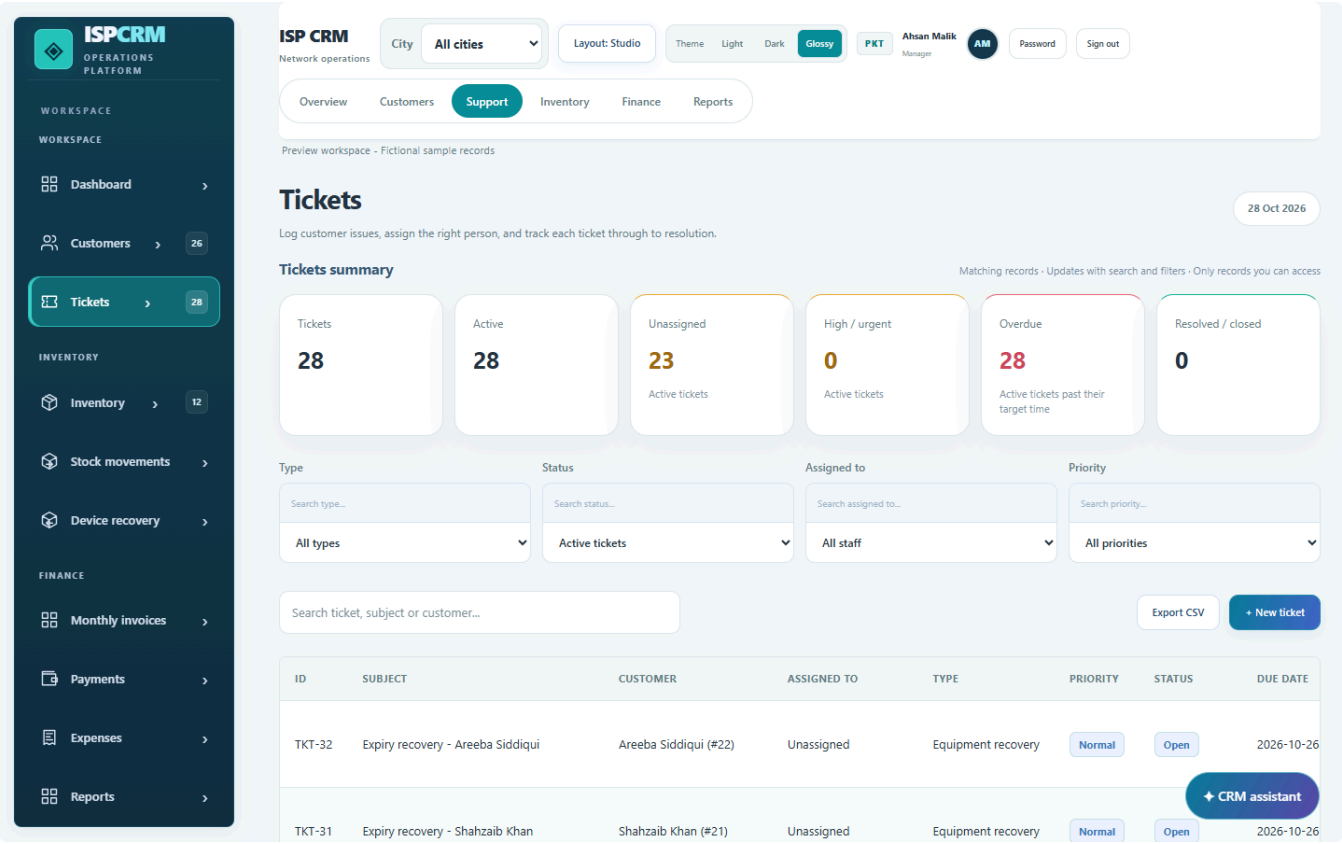

MRC and OTC. Choose **MRC** for monthly bill payments and **OTC** for one-time charges (installation, equipment, service). OTC needs a short description in Reference. The two are reported separately.

Saved receipts cannot be edited or deleted, so check the amount before saving. Online methods (1LINK, Easypaisa, JazzCash) are reserved for future automatic connections and are not live yet.

Balances. The customer list and account page show the account balance. The Ledger tab lists every bill and payment, so you can explain any balance to a customer.

Tickets and support

A ticket records every customer problem or field job from the first call until it is fixed, with a target time (TAT) so nothing is forgotten.

Log a ticket

1. Press **+ Add** on Tickets, or **+ Log ticket** on the customer's page.
2. Write a short subject and pick the customer.
3. Choose the type: Network outage, Slow speed, Billing, Installation, Complaint, Maintenance, Collection, Equipment recovery, Equipment or Other.
4. Choose the priority: Low, Normal, High or Urgent. The due time is set from the TAT settings.
5. Assign a staff member and save.

Statuses in order: Open → In progress → Awaiting customer → Resolved → Closed.

- A ticket must be assigned to someone before it can be In progress or Resolved.
- Resolved and Closed need **resolution notes** saying what was done.
- Every change is saved in the ticket's activity history.

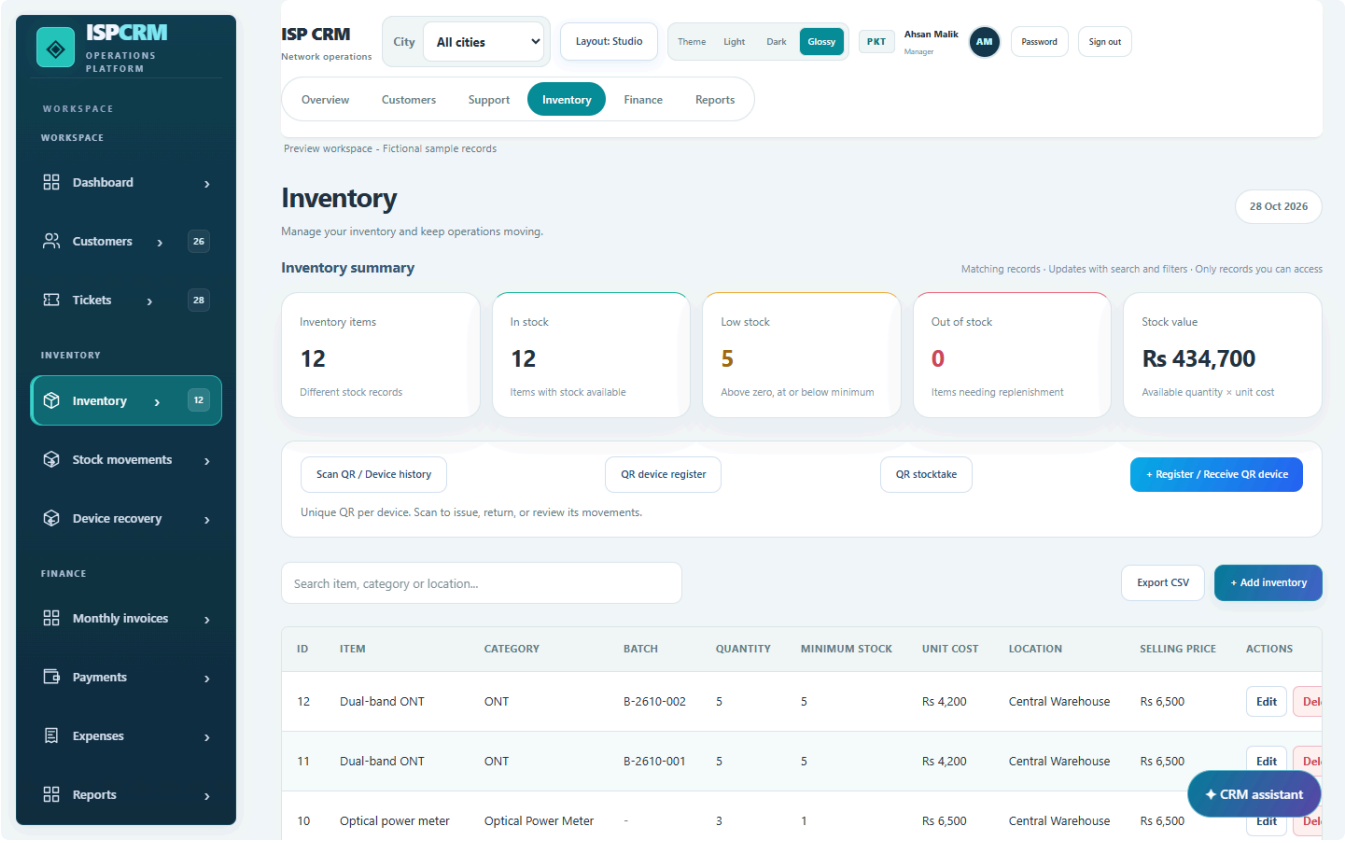

TAT (turnaround time). Settings → TAT settings holds the hours allowed for each ticket type and priority, for example how many hours an Urgent network outage may stay open. The list shows the time remaining, and late tickets are marked **Overdue** on the tickets page and the dashboard.

Filters at the top narrow the list by type, status (active tickets by default), assigned staff and priority.

Technicians only see tickets assigned to them, and can update those.

Inventory and stock

Inventory tracks every item you buy (routers, ONTs, cable, splitters) by batch, and every item given out is recorded as a stock issue so stock levels stay correct.

Add stock (a new batch)

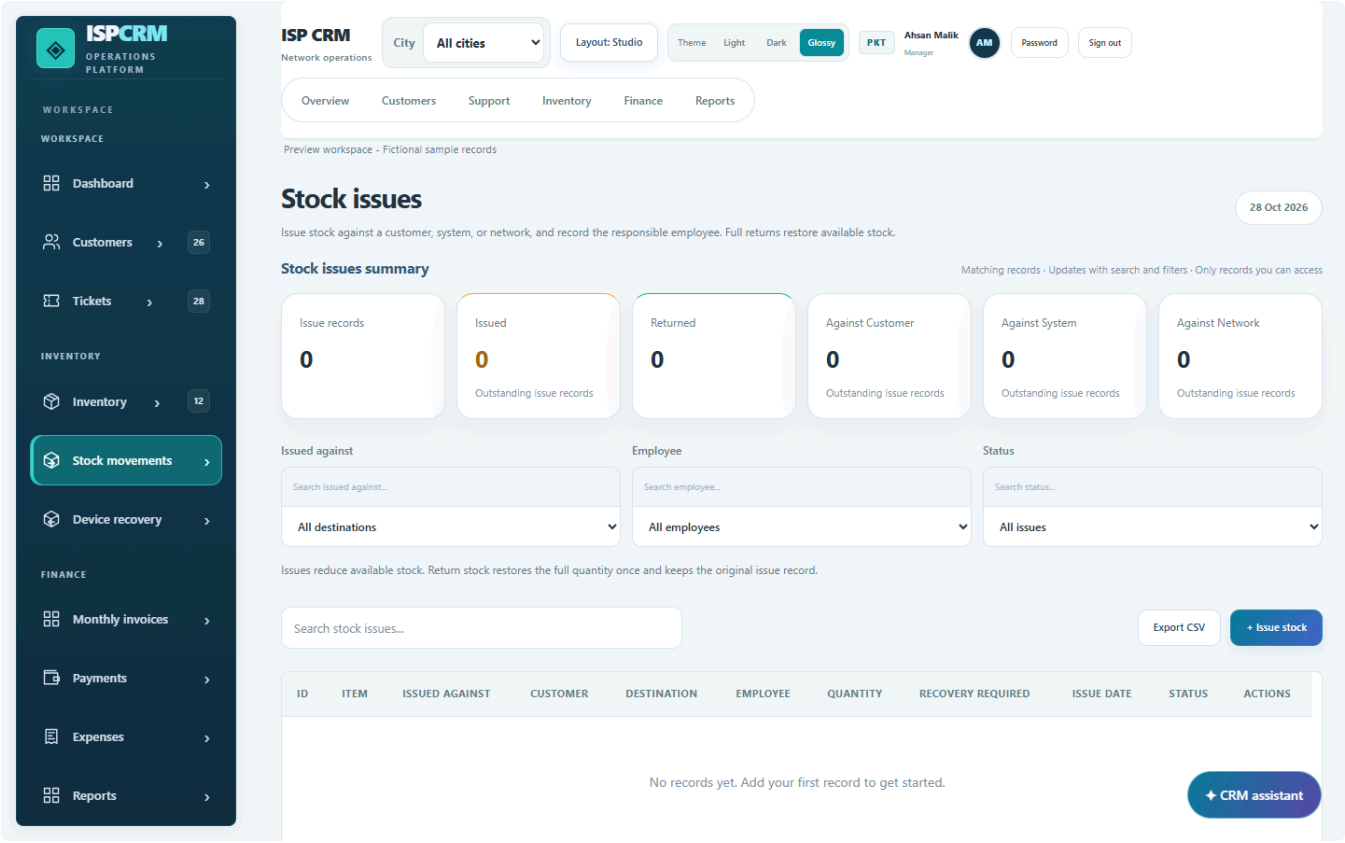

1. Inventory → **+ Add**.
2. Enter the item name and category.
3. The **batch number** fills in by itself, for example B-2610-003 (year, month, number). Each purchase is its own batch.
4. Enter quantity, minimum stock (for low-stock alerts), **unit cost** (what you paid), **selling price** (what customers are charged) and storage location.
5. Attach the supplier's invoice (photo or PDF) in the same form, then save.

Each batch keeps its own cost and price, so an old batch bought cheaper is charged at its own price. Press **Invoices** on a batch row later to view or add invoice files.

Low stock. When available quantity falls to the minimum, the item appears in Stock watch on the dashboard.

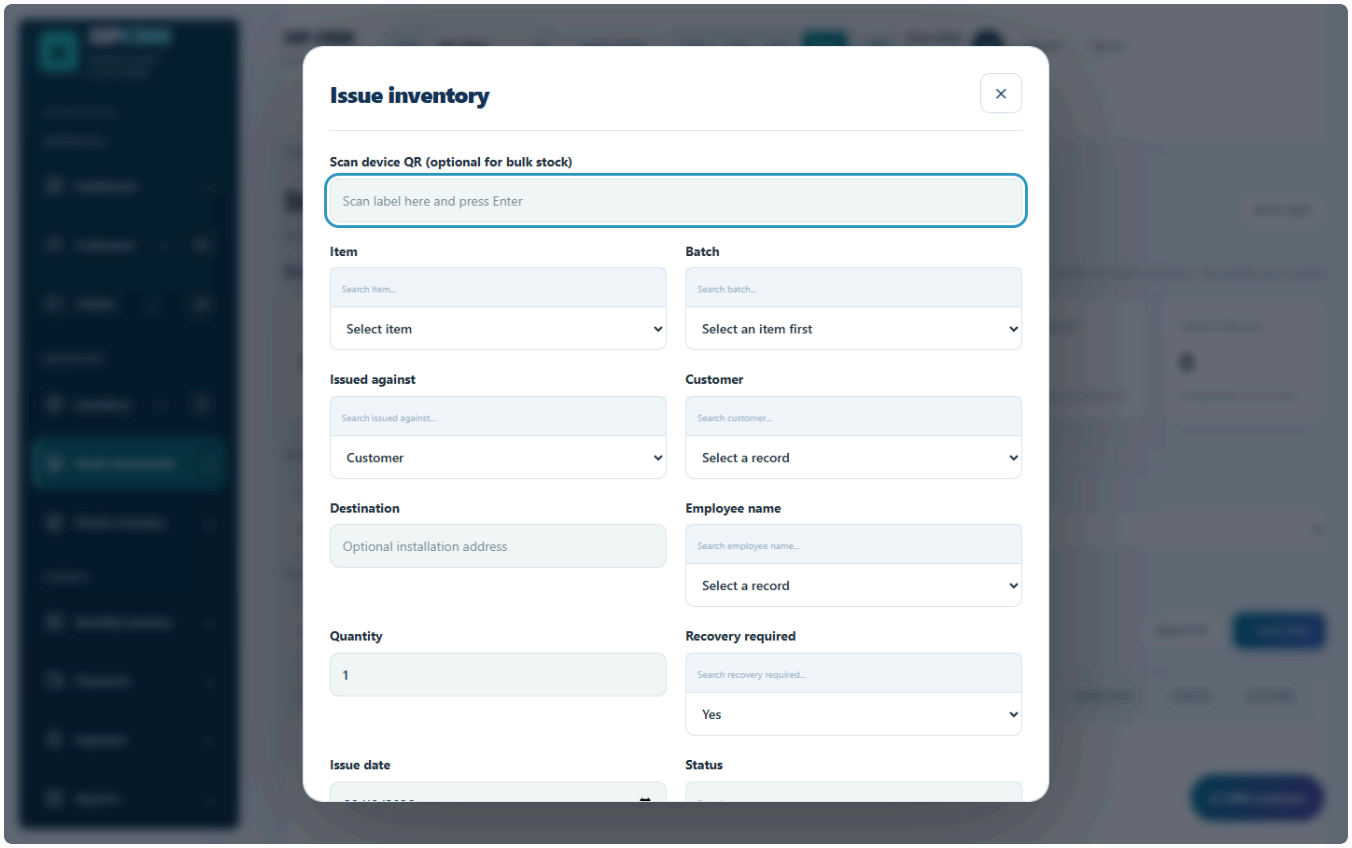

QR labels. Devices with serial numbers can carry a printed QR label. Scanning the label in a stock form fills in the device automatically.

Issue stock (Stock movements)

1. Stock movements → **+ Add**, or **Issue stock** on a customer's page.
2. Scan the device QR if it has one, or choose the **Item**, then the **Batch** from the list.

3. Choose **Issued against**: Customer, System or Network. For a customer, pick the customer; otherwise write where it went in Destination.
4. Employee is optional: choose who took the item if known.
5. Enter quantity and whether the item must be recovered if the customer leaves.
6. Choose the pricing for customer issues (below), then save.

Pricing	What the customer pays
Charge	The batch's selling price × quantity, filled in automatically.
Discount	The price minus the discount percent you enter.
Waived	Nothing. The item is still taken out of stock.

Charged items appear on the customer's ledger as a one-time charge.

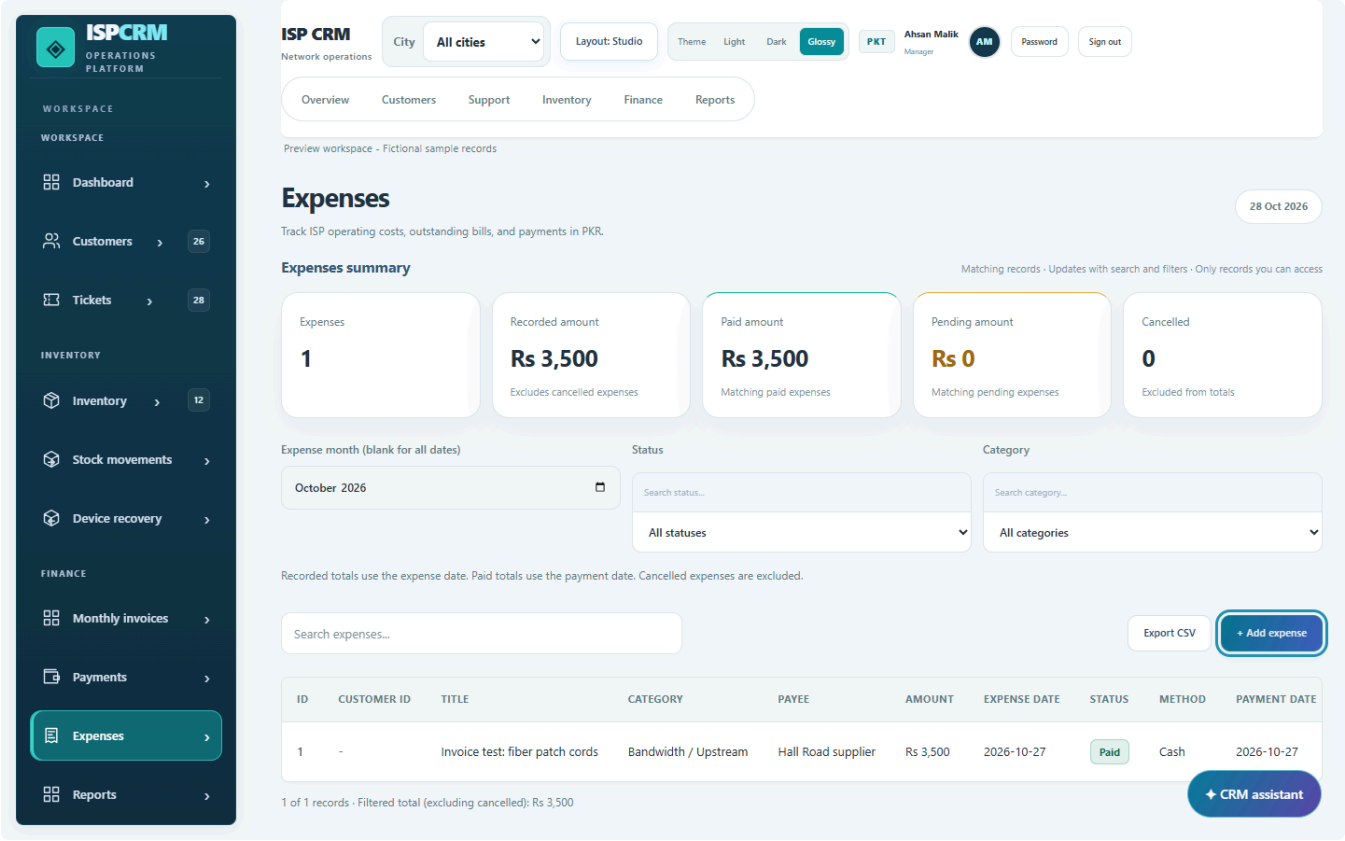

Read a device label from a photo. In the stock form, take or upload a photo of the router/ONT label. The CRM reads the make, model, MAC address and serial number on the computer itself (no internet needed) and fills them in. Always check them; you can correct any field. If nothing is found, type the details by hand.

Returns and deletion. Return stock puts the full quantity back once and keeps the original record. Only an Administrator can delete a stock issue entered by mistake.

Device recovery lists terminated customers who still hold CRM equipment, so a technician can collect it and mark it Recovered.

Expenses

Record every business cost here (bandwidth, salaries, rent, electricity, fuel, equipment) so profit & loss is correct. Only **Paid** expenses count against profit.

Add an expense

1. Expenses → **+ Add**.
2. Enter a title, category, payee (who you paid) and amount.
3. Choose the status: **Paid** (enter the payment date and method: Cash, Bank transfer or Mobile wallet), **Pending** (not paid yet) or **Cancelled**.
4. Add a reference such as the bill number, and notes if useful.
5. Attach the bill or receipt (photo or PDF) under invoice files, then save.

Business or customer cost. Expenses are business costs by default, so no customer is needed. Tick **Charge this cost to a specific customer (activation cost)** only when the cost belongs to one customer's connection; the customer field then appears.

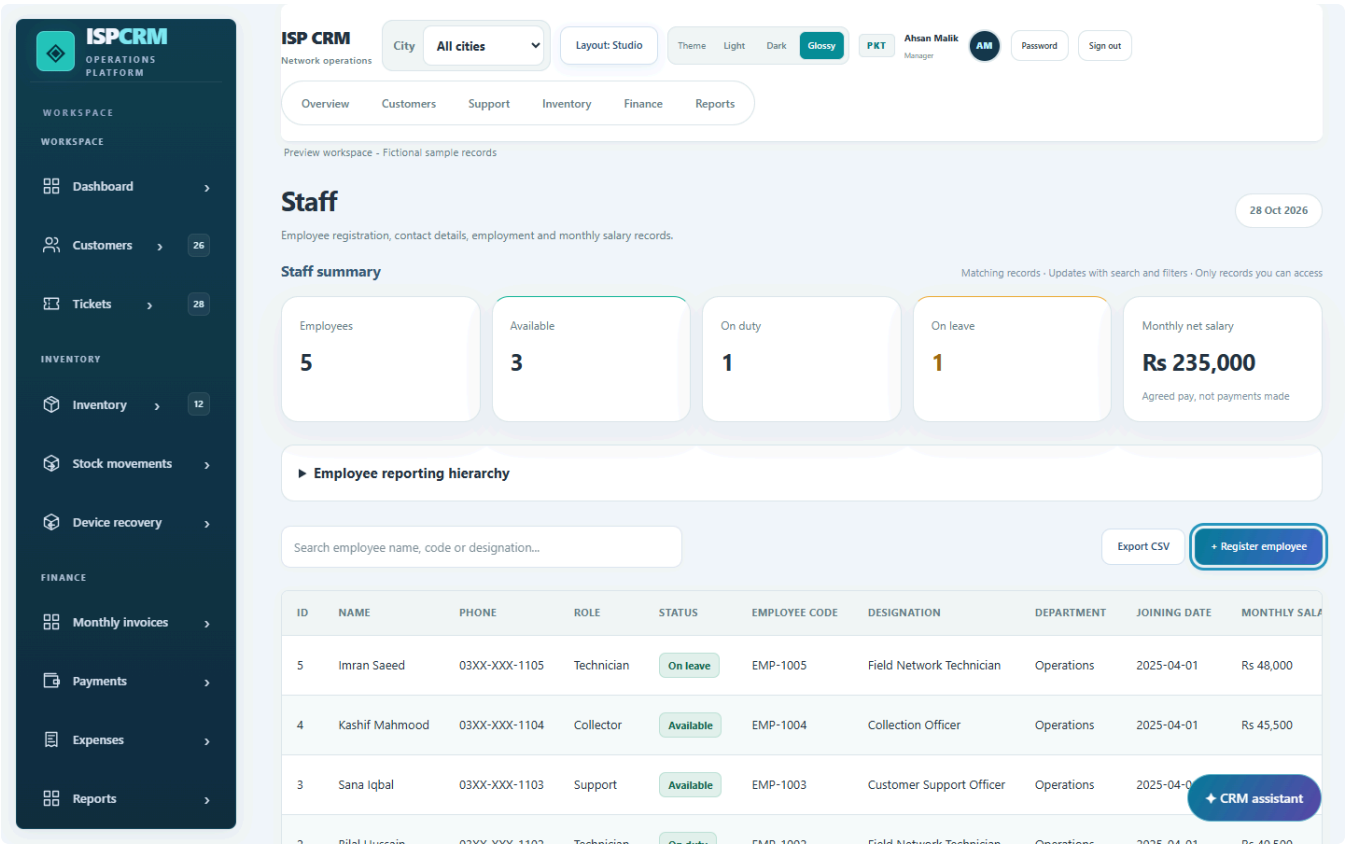

The categories cover typical ISP costs: Bandwidth / Upstream, Fiber lease, Tower / Pole rent, POP / Site rent, Staff salaries, Office rent, Electricity, Generator fuel, Fuel / Transport, Equipment purchase, Fiber / Cable, Installation labor, Repairs, Software, Marketing, Bank charges, Taxes, Other and more.

Filters show one month, one status or one category. The summary shows totals; recorded totals use the expense date and paid totals use the payment date. Press **Invoices** on any expense row to view or add its files.

If you pay upstream bandwidth bills as expenses, set the package monthly cost to 0. Otherwise that cost is counted twice in profit & loss.

Staff, users and roles

Staff are your employees; **users** are the accounts people sign in with. A user can be linked to a staff record, and a technician must be linked so they see their own tickets and stock.

Staff records hold name, phone, CNIC, role (Technician, Support, Collector, Manager, Other), area, availability (Available, On duty, On leave), designation, department, joining date, emergency contact, bank details and salary (monthly salary, allowances, deductions; net salary is calculated). An employee code is created automatically. **Reports to** builds the team hierarchy. Salary and bank details are visible only to Administrators and Managers.

User accounts (Settings → Users, Administrator only): enter name, username, designation, role and status, and optionally link the staff record. Set the user Inactive to block sign-in without deleting history. Each person changes their own password with **Password** in the top bar.

What each role can do

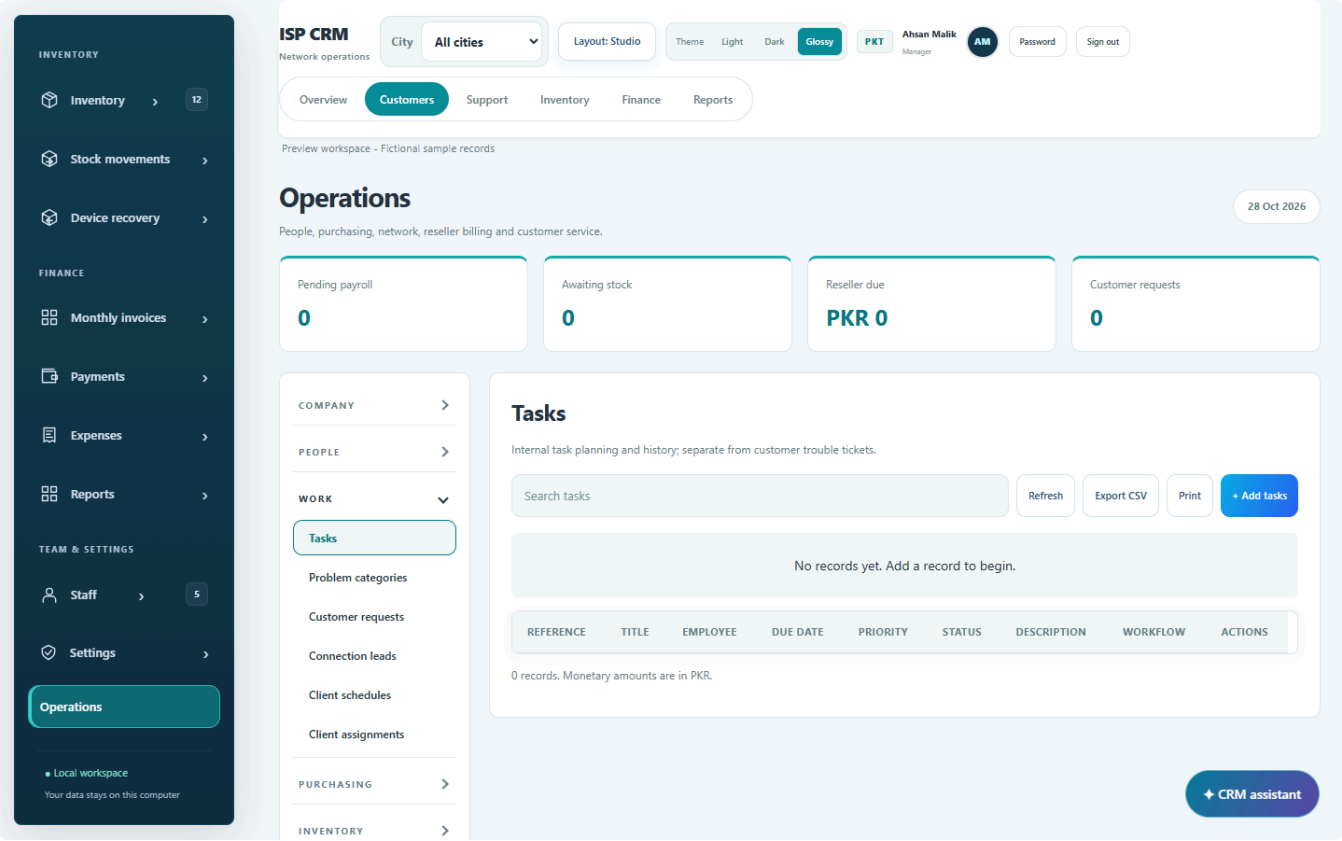

Role	Can see	Can change
Administrator	Everything, including user accounts	Everything; can delete records and stock issues
Manager	All business pages	All business pages; no user accounts
Accountant	Customers, packages, payments, expenses	Payments and expenses
Support	Customers, staff, packages, jobs, tickets	Customers, jobs, tickets
Technician	Customers, staff, stock, own tickets and own stock issues	Own jobs and tickets
Storekeeper	Customers, staff, inventory, stock issues, categories	Inventory and stock issues
Viewer	All business pages	Nothing (read-only)

Only Administrators, Managers and Accountants can record payments. Operations modules have their own rules, shown in the next section.

Operations workspace

Operations holds everything beyond daily billing: company setup, HR, purchasing, network records, bandwidth, reseller billing and customer communication. Open it from **Operations** at the bottom of the left menu, then pick a module in the grouped list on the

left.

The cards at the top show pending payroll, purchases awaiting stock, reseller amount due and pending customer requests. Every module has search, **Refresh**, **Export CSV**, **Print** and **+ Add**. **View / history** shows who did what and when.

Group	Modules	Used for
Company	Companies, Areas, Branches, Business settings	Company details; **Areas** with their **City** (drives the city picker and customer area list); receipt footer and currency.
People	Departments, Attendance, Payroll, Appraisals	Daily attendance; monthly salary records (**Generate month** creates them from staff salaries, **Pay** posts a Paid expense); performance reviews.

Group	Modules	Used for
Work	Tasks, Problem categories, Customer requests, Connection leads, Client schedules, Client assignments	Internal tasks; requests from customers; new-connection enquiries; package or status changes scheduled for a date; which staff member handles which client.
Purchasing	Vendors, Requisitions, Purchase bills	Suppliers; stock requests for approval; supplier bills (**Receive stock** adds to inventory, **Pay** posts the expense).
Inventory	Assets	Company-owned equipment such as generators, vehicles and tools.
Network	Zones, Sub zones, POPs, Network devices, Network links, Fiber segments, Network map	Your network layout and cables (see the next section).
Bandwidth	Bandwidth items, providers and bills; Resellers, Reseller invoices and receipts	Upstream bandwidth bills (**Pay** posts an expense) and billing for resellers.
Services	OTT subscriptions, Customer links	Extra services and useful links shown to customers.
Finance	Collection approvals, Discount requests, Cash accounts, Cash transactions	Field collections that finance approves before they post as payments; discount decisions; manual cash and bank books.
Communications	Customer messages, Message templates, Message queue, Notices	In-app chat with customers, reusable message texts, notices for staff or customers.

Actions on records

- **Approve / Reject**: requisitions, customer requests, collection approvals, discount requests. Approving a collection posts the payment and may recharge the customer.
- **Pay / post expense**: payroll, purchase bills and bandwidth bills. It records a Paid expense; no money is sent from the bank.
- **Apply change**: applies a scheduled or requested package or status change.

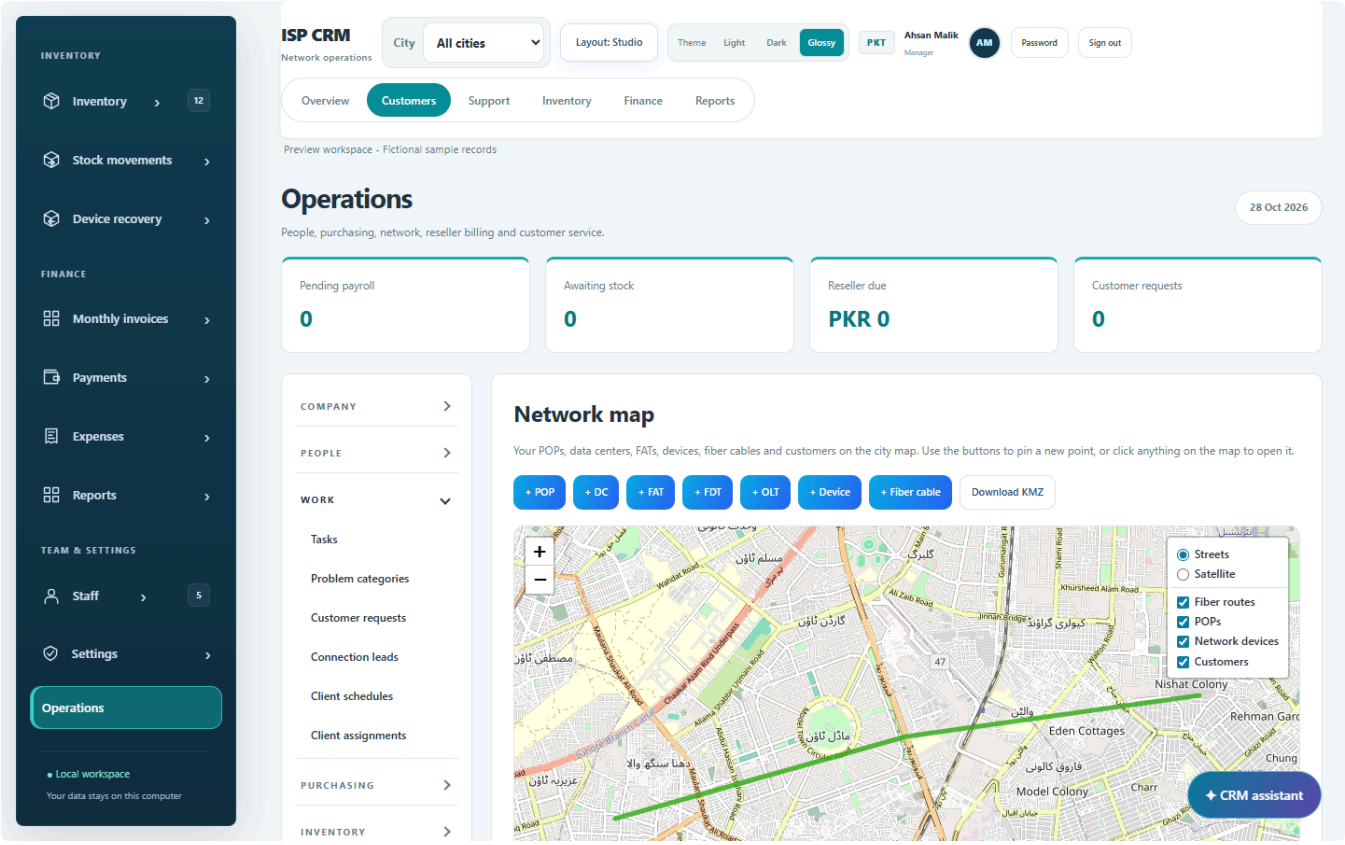

- **Archive** hides a finished record; **Delete** (Administrator and Manager) removes it permanently.

Customer tools and review in the same menu: Import customers CSV, Bulk customer status, Staff performance (tickets assigned, resolved and on time), Financial summary, Network diagram, Download KMZ map and Integration status.

SMS, email, router (MikroTik/RADIUS) and online payment links are shown as **Not configured**; the CRM does not send or connect to them yet.

Network map and fiber

The Network map shows your POPs, data centers, FATs, devices, fiber cables and customers on a real city map. Open it from Operations → Network → **Network map**.

Map controls. Zoom with + and − or the mouse wheel. Switch between **Streets** and **Satellite** at the top right, and tick or untick Fiber routes, POPs, Network devices and Customers to show or hide them. Click anything on the map to open it.

Add a POP, DC, FAT or other device

1. Press the button for what you are adding: **+ POP**, **+ DC**, **+ FAT**, **+ FDT**, **+ OLT** or **+ Device**.

2. Click its exact location on the map. The pin drops there and the coordinates fill in.
3. Fill in the name and details. For a device, choose the **Stock item** if it came from inventory, then save.

Draw a fiber cable

1. Press **+ Fiber cable**.
2. Click along the cable's path on the map, point by point. The length is calculated as you draw.
3. Choose cable type (Drop, Distribution, Feeder, Backbone), core count and status (Planned, Active, Damaged, Retired).
4. Optionally link the start and end devices, the **Cable stock item** and who installed it, then save.

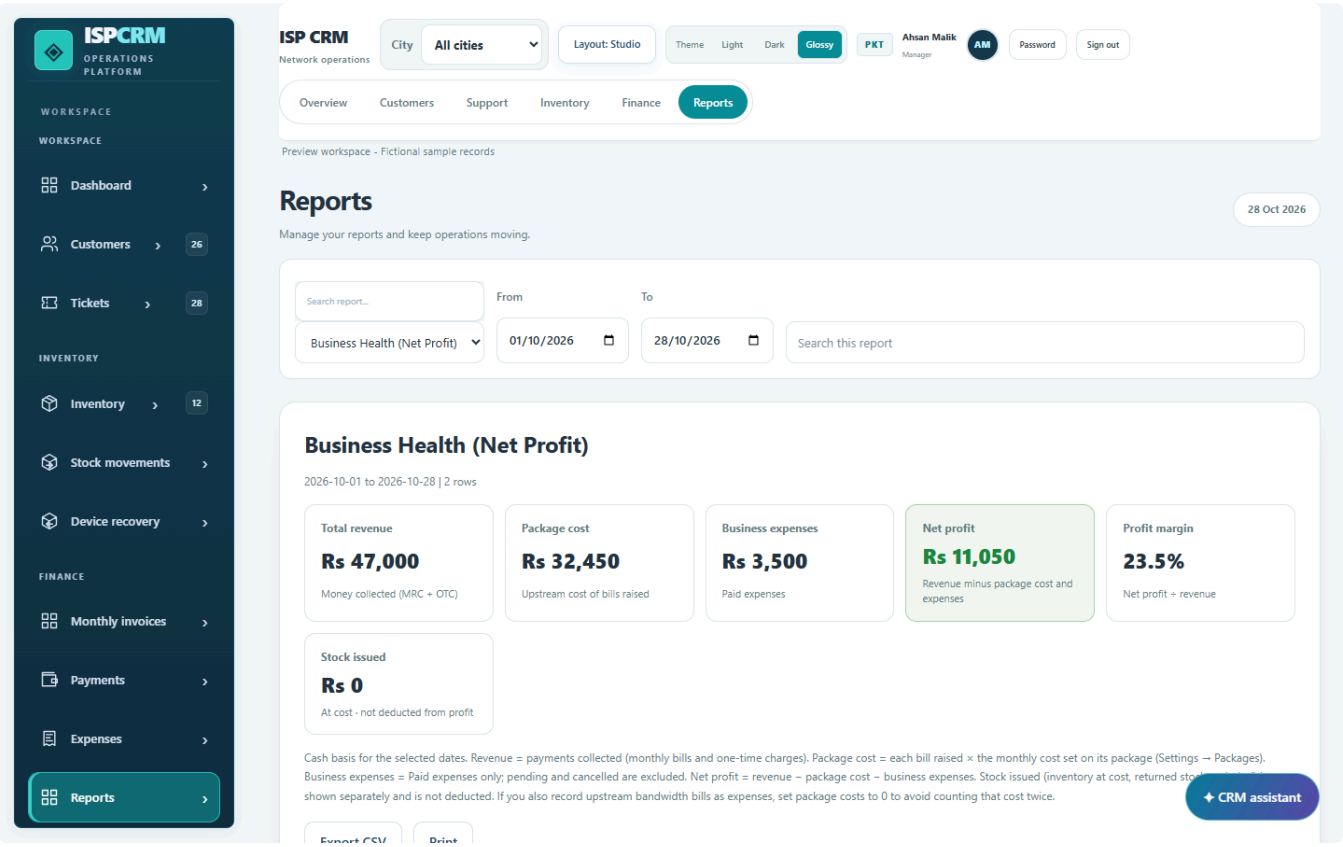

Automatic stock deduction

- A device with a Stock item takes 1 unit out of inventory.
- A cable that is not Planned takes its length out of stock: the **Cable used m** you enter, or the drawn route length if left blank.
- Each deduction appears in Stock movements as a Network issue.
- Deleting the device or cable, or setting a cable back to Planned, returns the stock.

Delete a pin or cable from its record (Administrator and Manager). **Download KMZ** saves the whole network as a file that opens in Google Earth.

Reports

Reports turn your records into summaries for any date range. Pick a report, set **From** and **To**, and use the search box to narrow the rows. Every report can be exported to CSV or printed.

Business Health (Net Profit) shows month by month:

- **Total revenue**: money actually collected (MRC + OTC).
- **Package cost**: for each bill raised, the monthly cost set on its package.
- **Business expenses**: Paid expenses only.
- **Net profit** = revenue − package cost − business expenses, and **profit margin** = net profit ÷ revenue.
- **Stock issued** at cost, shown separately and not deducted from profit.

Profit & Loss Statement shows the same figures as a statement: income, cost of service, gross margin, operating expenses and net profit.

Report	What it answers
Inventory Reconciliation	Stock received, issued, returned and on hand per item.
Monthwise Collection	Money collected in each month.
Collection Reports	Payments received in the date range.
Promise Date Report	Customers who promised to pay by a date.

Report	What it answers
Expiry Report	Accounts expiring or expired in the range.
Staff Collection	How much each staff member collected.
Collection Report 1	An alternative collection layout.
Accounts Report	Customer bills, payments and balances.
Daily Sales Report	Sales and collections day by day.
Transaction Wise Report	Every payment transaction listed.
Recharge Report	Accounts recharged and when.
Package Wise Report	Customers and revenue per package.

Accountants and managers see the money reports; Inventory Reconciliation needs inventory access. When a city is selected in the top bar, reports cover that city's customers only.

Customer portal and other tools

Customer portal. Customers have their own self-service page at the CRM address followed by **/customer/** (also linked from the sign-in page). They sign in with their 9-digit customer payment ID and a password, and can install it on their phone like an app.

Image — The customer portal sign-in

In the portal a customer can:

- See account status, internet plan, expiry date and amount due.
- View and print monthly bills and payment receipts.
- Read notifications, notices and useful links.
- See their support tickets and send requests: support, package change, status change or profile update.
- Message your support team, and change their own password.

To give a customer access, open their account and press **Customer app access**. Requests and messages arrive in Operations (Customer requests, Customer messages). Customers cannot pay online through the portal yet.

CRM assistant. The ✦ **CRM assistant** button at the bottom right answers "how do I…" questions about the CRM and gives a quick summary of your data. It only reads; it cannot record payments or change anything.

Import customers from CSV (Operations → Customer tools). Paste or upload a CSV with name, phone, username, package, latitude and longitude, up to 200 rows at a time. All rows are saved together or none are.

Bulk customer status changes many customers to Active, Suspended or Disconnected in one step. Terminated accounts are skipped; terminate them one by one from their account page.

Daily routine and common questions

Every day

- [ ] Check the Dashboard: collections, expired accounts, overdue tickets, low stock.
- [ ] Record every payment received the same day, with the right billing month.
- [ ] Assign new tickets and close finished ones with resolution notes.
- [ ] Record stock given out in Stock movements, with the device photo for routers and ONTs.
- [ ] Enter paid expenses and attach the bill.

Every month

- [ ] Follow up customers on the Expiry Report and unpaid bills.
- [ ] Generate and pay payroll in Operations → Payroll.
- [ ] Review Business Health (Net Profit) and the Profit & Loss Statement.
- [ ] Check Device recovery for equipment still with terminated customers.

Common questions

A customer paid but is still expired. The payment was partial, or for a different billing month. Check the Ledger tab; record the rest, or ask a manager to approve partial activation.

I recorded the wrong payment amount. Saved receipts cannot be edited. Tell your administrator so it can be corrected properly.

A new area does not appear in the customer form. Add it in Operations → Areas with status Active and its City. If a city is selected in the top bar, only that city's areas appear.

I cannot see a page or button. Your role does not allow it. Ask your administrator.

The numbers look different from yesterday. Check the City picker in the top bar; choose **All cities** to see everything.

A page looks broken after an update. Press Ctrl+F5 to reload it fully.

Where is my data kept? On the office computer running the CRM, in its own database. Keep regular backups and never share passwords.
